TORNADO / MENA ARKANSAS, UNITED STATES/ APRIL 10, 2009.

On April 10th 2009 there were at least 27 tornados that hit areas in the southern United States. The Mena tornado had the largest impact when it descended in Oklahoma and crossed the border into Arkansas. The residents from Mena had warning sirens going and this helped to minimize the loss of life, but the damage to the location was fairly significant. The terrain area affected by this tornado was large and the town of Mena was extensively damaged. There are many reports online about this event. While the impact on human suffering and life may be an issue, the tasker's main interest is in the weather event in relationship to cultivated areas and structures in the area affected.
